Bolo – User Accounts and Login Credentials

Recruitment and job application tracking platform · Demonstration environment · Company: **Wouri Distribution SARL** (fictitious)

1. Where to log in

Page	Address
HR back-office (login required)	`http://localhost:5173/connexion`
Public career page (no login – for candidates)	`http://localhost:5173/carrieres/wouri-distribution`

> The API (`npm run dev` in `server/`) and the interface (`npm run dev` in `client/`) must both be running. The accounts below are created by `npm run db:seed` .

2. User accounts

#	Full name	Login e-mail	Password	Role	Position
1	Ekwalla Serge	`admin@wouri-distribution.cm`	`Bolo#2026`	**Admin**	Administrator
2	Ngo Bisseck Laure	`rh@wouri-distribution.cm`	`Bolo#2026`	**HR**	HR Manager
3	Tchoumi Hervé	`h.tchoumi@wouri-distribution.cm`	`Bolo#2026`	**Recruiter**	Logistics – assigned to *Forklift warehouse operator* and *Heavy-goods delivery driver*
4	Abena Christelle	`c.abena@wouri-distribution.cm`	`Bolo#2026`	**Recruiter**	Finance – assigned to *Senior accountant*

All four accounts were tested and log in successfully. The password is case-sensitive: capital **B**, then `olo` , the hash sign `#` , then `2026` .

3. What each role can do

Action	Admin	HR	Recruiter
See the dashboard, jobs, pipeline and candidates	✔	✔	✔
Open and read CVs (every view is logged)	✔	✔	✔
Rate candidates and move them between stages	✔	✔	✔
Add a CV received by WhatsApp, e-mail or on paper	✔	✔	✔
Create, edit, publish and close job offers; change their stages	✔	✔	✘
Edit the message templates sent to candidates	✔	✔	✘
Read the access log (audit trail)	✔	✔	✘
Create user accounts	✔	✘	✘

Recruiters receive notifications only for the job offers they are assigned to; Admin and HR are notified for every offer.

4. Candidates

Candidates do **not** have an account or a password. They apply from the public career page and follow their application through a personal tracking link (`/suivi/<code>`) shown after they apply and sent in the acknowledgement message.

5. Security notes

> **Demonstration accounts only.** These credentials belong to fictitious data created for testing and presentation. Passwords are never stored in clear text: the database keeps only a bcrypt hash. Before any real use, the demo data must be removed (do not run `npm run db:seed` on a production database – it erases everything), real accounts must be created by the administrator with strong individual passwords, and `JWT_SECRET` and `CV_ENCRYPTION_KEY` must be set in `server/.env`.

A session expires 8 hours after login. Running `npm run db:seed` again resets the whole database and recreates exactly these four accounts.
